DETAILED ACTION

1. Claims 1-62 are presented for examination.

Double Patenting

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-62 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-62 of copending Application No. 09/844992. Although the conflicting claims are not identical, they are not patentably distinct from each other because all the limitations in claims 1-62 in the instant application are either similar or an obvious combinations of claims 1-62 in "09/844992". Both of the instant applications and "09/844992" are devoted to A system for controlling real-time transport protocol flow through multiple via use of a media flow routing. The copending application discloses the same limitations as the present application with the exception of primary route is a path from first computer to second computer via plurality of associated computers. However routing and router functionality are well known in the art (router definition: A device that determines the next network point to which a data packet should be forwarded enroute toward its destination. The router is connected to at least two networks and determines which way to send each data packet based on its current understanding of the state of the networks it is connected to. Routers create or maintain a table of the available routes

and use this information to determine the best route for a given data packet). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to include and implement router functionality. The motivation would have been to have system that find and assigns optimal route path based on the routing policy.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Above cited Arts are to show system and method for assisting in controlling real-time transport protocol flow through multiple networks via

use of a cluster of session routers, which is considered pertinent to the claimed invention.
